

More filled appointments. Less time chasing replies.

Lena and Carla currently coordinate Square, a spreadsheet, and texts. Separate replies have left two clients believing they had the same slot.

8–12

late cancellations each week

Lena's refill target

Customer estimates and target, not measured prototype results. Source: Lena interview, turns 4 and 9.

An acceptance holds the spot

Staff complete the booking in Square before recording confirmation.

01 Match the waitlist

Service, duration, stylist, time, and permission to contact.

02 Offer one at a time

Earliest eligible client gets an exclusive 15-minute offer.

03 Hold, then confirm

Lena or Carla updates Square.

What happens when things go wrong?

Temporal remembers who has the offer and how long they have to answer.

The app stops while someone is deciding

We stopped and restarted the software handling the waitlist. It remembered the same client and their original deadline.

A text won't go through

For a temporary problem, the demo tries sending again. If delivery fails, it offers the opening to the next client who fits.

We tested these situations in the prototype. Text messages are simulated.

A client replies after their time is up

They see that their offer has expired. They cannot claim a spot now offered to someone else.

A client taps “yes” twice

Their spot stays held. The second tap does not create another reservation.

A two-week trial with Lena and Carla

0

slots promised to two clients

Before the first real text

- Connect real texts and the waitlist.
- Add staff sign-in and permission to text clients.
- Check Square before confirming each booking.

Demo: fictional clients and texts.
Staff still update Square manually.

Example dates, not a commitment. Start only after setup and testing. Targets are not results.
